DELISHFUL

Good Food. Delivered Fast.

AI Restaurant Assistant

Complete Design Specification

Natural-language restaurant discovery, menu exploration, personalized recommendations, offers, ordering guidance and reservations assistance - powered by an intelligent food concierge.

Version 1.0

Prepared: 10 September 2026

8 restaurants | 113 dishes | 4 coupons | Delivery + Reservations + AI chat

1. Executive Summary

Delishful is a full-stack food ordering platform that connects customers with local restaurants. This document is the complete engineering and product specification for a new capability: the Delishful AI Restaurant Assistant. The assistant is a conversational agent embedded directly in the web application that helps customers discover restaurants, explore menus, get personalized food recommendations, answer questions, and guide them through ordering and reservations.

The assistant is designed as a hybrid system. When a live AI API key (OpenAI-compatible: OpenAI, DeepSeek, Groq, OpenRouter, Ollama, and others) is configured, it uses a production-grade language model instructed by a domain-specific system prompt over live platform data. When no key is configured, the platform transparently falls back to a deterministic offline rule engine that answers the same questions using the same data, so the feature never goes down.

- Live AI mode - Uses the configured chat-completions provider for natural, conversational answers with full language understanding.
- Offline fallback - A rule-based engine over the same restaurants, foods, and coupons data keeps the assistant available without any API key.
- No new infrastructure - The assistant reuses the existing Express API, MongoDB data layer, and React frontend.
- Context aware - Every request is grounded in the current restaurant catalog, food menu, and active coupons - the assistant never invents data.
- User-friendly UX - A floating chat widget on every page with quick prompts, typing indicator, and formatted responses.

2. Vision and Goals

We want every customer to feel like they have a personal food concierge in their pocket - someone who already knows the menu, the prices, the best sellers, and the coupons, and can turn "what should I eat tonight?" into a delivered order in seconds.

2.1 Product Goals

- Reduce choice paralysis: turn a large catalog into a short, personalized, trustworthy shortlist. -
- Increase conversion: move customers from browsing to cart faster through guided ordering. -
- Surface offers: proactively connect customers with applicable coupons and restaurant discounts. -
- Answer instantly: resolve menu, price, dietary, timing, and process questions without digging through the UI. -
- Support every page: the assistant is available globally, not just on one screen. -

2.2 Success Metrics

Metric	Definition	Target
Conversation starts / DAU	Assistant opened at least once per active user / day	> 35%
Recommendation	User navigates/adds a dish referenced by the assistant	> 40%
Coupon redemption via	Coupon code surfaced by assistant redeemed in	> 20%
Assisted order rate	Orders placed after an assistant conversation	> 15%
Resolution rate	Questions answered without human handoff	> 90%
Response time p95	Time from send to rendered answer	< 3 s

3. System Architecture

The assistant is a thin conversational layer over the existing platform. A new POST /api/ai/chat endpoint accepts the user message and recent history, snapshots the current catalog data, builds a grounded system prompt, and returns a plain-text answer rendered by the frontend widget.

3.1 Components

Component	Technology	Responsibility
React SPA	React 19 + Vite + lucide-react	Renders the chat widget on every route; manages
API client	fetch-based client (src/api)	Authenticates and calls /api/ai/chat
Express API	Node.js + Express 5	Serves the endpoint; orchestrates data + provider
MongoDB	Mongoose ODM	Stores restaurants, foods, coupons, users, carts, orders
AI provider	OpenAI-compatible chat	Generates natural-language replies when configured
Rule engine	Deterministic intent matcher	Offline fallback with identical data grounding

3.2 Request Flow

3.3 Why OpenAI-Compatible?

The OpenAi-compatible chat-completions contract is the de-facto standard. Supporting AI_BASE_URL + AI_API_KEY + AI_MODEL means the assistant can use OpenAI, DeepSeek, Groq (free tier), OpenRouter (one key for many models including Claude and Gemini), Together, Azure OpenAI, or a local Ollama instance - with zero code changes.

4. Data Model

The assistant reads from existing collections; it introduces no schema changes. Fields shown are those most relevant to conversation grounding.

4.1 Restaurant

Field	Type	Example	Used for
id	Number	1	Menu lookup
name	String	Spice Route	Naming restaurants
cuisine	String	Indian	Cuisine filtering
rating	Number	4.5	Top-rated answers
reviews	Number	2314	Trust signals
deliveryTime	Number	25	Delivery questions
priceRange	String	Rs. 200 - Rs. 500	Budget advice
discount	String	50% OFF up to Rs. 100	Offers context
vegetarian	Boolean	true	Dietary answers
categories	String[]	Starters, Biryani	Menu structure

4.2 Food

Field	Type	Example	Used for
name	String	Chicken Biryani	Dish naming
price	Number	290	Pricing & budget
rating	Number	4.7	Recommendations
veg	Boolean	false	Vegetarian queries
bestseller	Boolean	true	Popular picks
category	String	Biryani	Cuisine matching
ingredients	String[]	Basmati Rice, Saffron	Dietary answers
sizes	Number[]	290, 390, 490	Price comparison

4.3 Coupon

Field	Type	Example

Field	Type	Example
code	String	WELCOME50
type	String	flat | percent
value	Number	50
maxDiscount	Number	150
minOrder	Number	250

5. The AI Assistant

A conversational concierge with five core capabilities: discover, explore, recommend, answer, and assist.

5.1 Capabilities

Capability	Customer need	Example utterance
Discover restaurants	Find where to eat	"best biryani place around me"
Explore menus	See what is available	"show me Pizza District menu"
Personalized recommendation	Decide quickly	"recommend a veg dinner for two under Rs
Answer questions	Understand options	"is it vegetarian? how much is delivery?"
Guide ordering	Complete the purchase	"how do I place an order?"
Assist reservations	Book ahead	"can I reserve a table?"
Share offers	Save money	"any coupons today?"

5.2 System Prompt Design

The assistant is instructed by a fixed system promp
capability rules, and hard grounding constraints. It
current catalog, selected by relevance: top 25 resta
distinct cuisines, and up to 10 active coupons.

5.3 Provider Integration

The provider layer posts {model, messages, max_tokens, temperature} to {AI_BASE_URL}/chat/completions with a Bearer token. The last eight conversation turns are included as history so answers

stay context-aware.

Env var	Default	Description
AI_BASE_URL	https://api.openai.com/v1	Base of an OpenAI-compatible
AI_MODEL	gpt-4o-mini	Model identifier
AI_API_KEY	(empty)	Enables live AI mode when set
AI_MAX_TOKENS	700	Answer length cap
AI_TIMEOUT_MS	45000	Provider call timeout

5.4 Offline Rule Engine

server/ai/local.js implements a determini
vegetarian/non-vegetarian filtering, budg
burger, paneer, noodles, dessert and mo
steps, and reservation guidance. If the a
automatically downgrade to this engine a

6. Conversation Flows

6.1 Discovery: "Best biryani"

6.2 Personalized recommendation: "Veg dinner for two"

6.3 Offers: "Any coupons?"

6.4 Ordering guidance

6.5 Reservations

Intent	Trigger words	Data used	Response
Greeting	hi, hello, hey	-	Intro + capabilities
Cuisine/dish	biryani, pizza, paneer...	Foods match name/category/	Matching dishes +
Veg / non-veg	veg, vegetarian, non	Food.veg flag	Filtered picks
Budget	under Rs X, cheap,	Food.price / sizes	Items within limit
Offers	coupon, offer, discount,	Coupons(active)	Code + type + min order
Best / recommend	best, top rated,	Restaurants.rating + reviews	Ranked shortlist
Restaurant name	spice route, pizza district	Restaurants.name	Profile + top dishes
Ordering	order, checkout, how to	Flow knowledge	Step-by-step
Reservation	book table, reservation	Policy knowledge	Guidance + redirect
Fallback	(else)	Capabilities	Help menu

7. API Specification

POST /api/ai/chat

Detail	Value
Method	POST
Path	/api/ai/chat
Auth	Optional (token auto-attached if logged in)
Body	{"message": string (required), "history": [{role, content}]}
Success	200 {"success":true,"reply":string,"provider":"ai"|"local","model":string}
Errors	400 missing message; 500 provider/data error

Request

Response

Existing Endpoints Used by the Client

Method	Path	Purpose
POST	/api/ai/chat	Send message, get assistant reply
GET	/api/restaurants	Browsing fallback
GET	/api/foods	Menu search
POST	/api/coupons/validate	Coupon validation
GET	/api/cart	Cart state
POST	/api/orders	Place order

8. Frontend Widget Specification

The assistant mounts globally in App.jsx as <ChatAssistant />, so the floating bubble is available on every route - including home, restaurant, cart, and checkout. It is implemented with React state, the lucide-react icon set, and the same brand palette used across the app (coral #FF6B35, navy #101828, warm cream backgrounds).

8.1 Components and Appearance

Element	Specification
Floating button	60px circle, bottom-right, coral gradient, MessageCircle icon (toggles to X when open)
Panel	372px wide (max 100vw - 36px), max-height 560px, rounded 18px, drop shadow, warm
Header	Brand gradient with Sparkles icon: "Delishful Assistant" + status line "AI food concierge,
Message bubble (user)	Right-aligned, coral background, white text
Message bubble	Left-aligned, white background, navy/grey text, 1px warm border
Quick prompts	Pill buttons shown before first message: recommend / offers / veg / biryani / order
Typing indicator	Animated spinner + "Delishful is thinking..."
Error state	Soft red banner with retry guidance
Input bar	Rounded input with Send button, disabled while loading

8.2 Markdown-lite Rendering

Assistant replies are plain text rendered client-side with a compact formatter: paragraphs, numbered lists, and **bold** spans. This keeps provider output simple and layout safe with full markdown library.

8.3 Conversation State

Conversation lives in component state; the last eight turns are sent with each request for c unmount (navigation), state is kept while the app is open so users can continue where the future enhancement may persist sessions server-side.

8.4 Accessibility and Mobile

The widget is fully keyboard-operable, uses aria-labels on icon buttons, and collapses to a width panel on small screens. The reduced-motion media query pauses decorative anima

9. Security and Privacy

- API key stays on the server - Never exposed to the browser; provider calls happen only in server/ai/provider.js.
- Grounded answers - System prompt forbids hallucinating restaurants, dishes, prices, or coupons.
- History bounded - Only the last eight turns are forwarded; full conversation is not persisted.
- No sensitive data - Assistant never asks for or relays payment details, passwords, or OTPs.
- Input sanitization - Messages are trimmed and length-limited before processing; provider output is escaped by the renderer.
- Timeouts & fallback - Provider timeouts and failures degrade to the offline engine instead of erroring.
- Optional auth - Rate-limited endpoint usable by guests; authenticated users get consistent cart guidance.

10. Performance and Cost

Concern	Mitigation
Latency	Data snapshot queries run in parallel (Promise.all); provider timeout at 45s
Token size	Context truncated to ~18k chars; max_tokens 700 keeps answers short and
Provider outage	Automatic downgrade to rule engine; zero downtime
Cold start	Rule engine has no external dependency; MongoDB already warm
Cost of offline mode	Rs. 0 - fully local
Cost of live AI (gpt-4o-mini)	Approx. 0.15-0.60 per 1k input / 0.60 per 1k output tokens; typical

10.1 Caching Opportunities

Frequent, identical questions (hours, coupons, how-to-order) can be short-circu
Redis-backed exact/approximate intent cache keyed on normalized message te
for the long tail of repetitive queries.

11. Testing and Quality Assurance

11.1 Functional Test Matrix

Test case	Input	Expected
Greeting	"hi"	Warm intro with capability list
Cuisine match	"recommend a biryani"	All biryani dishes with restaurant + price
Veg filter	"show veg options"	Only veg=true dishes
Non-veg filter	"chicken dishes"	Only veg=false / chicken dishes
Budget	"things under Rs 200"	Only items with price <= 200
Coupons	"any offers?"	Active coupons with codes and min order
Best rated	"best restaurant"	Sorted by rating desc, top 5
Restaurant lookup	"show Pizza District"	Profile + popular dishes
Ordering	"how do i order"	Five step ordering flow
Reservation	"book a table"	Delivery-first guidance
Unknown	"summon a dragon"	Help menu fallback
Empty message	""	400 with clear message

11.2 Quality Gates

- Lint: project oxlint config passes with zero errors. -
- Build: vite build completes; widget chunk lazy-loads on demand. -
- Provider error path: injected auth failure must return provider:"local" with note. -
- Performance: p95 AI latency under 3s; widget interaction stays in React strict-mode-safe patterns. -
- Regression: cart, checkout, coupons and search flows remain green. -

12. Deployment and Operations

12.1 Configuration

Variable	Where	Required for
AI_BASE_URL	server/.env	Provider base URL (default OpenAI)
AI_MODEL	server/.env	Model selection
AI_API_KEY	server/.env	Live AI mode; empty = offline only
AI_MAX_TOKENS /	server/.env	Tuning
JWT_SECRET	server/.env	Auth (existing)
MONGODB_URI	server/.env	Database (existing)

12.2 Rollout Plan

- Phase 1 (offline): ship rule engine only - zero cost, full coverage. -
- Phase 2 (live AI beta): enable AI_MODEL for a small user cohort; monitor cost and quality. -
- Phase 3 (full): roll out live AI globally with offline fallback; add analytics on suggestions and assisted orders. -

12.3 Monitoring

Log provider, error rate, latency, token usage, and fallback rate. Dashboards track conversation length and recommendation acceptance to tune the system prompt and the recommendation sorting logic.

13. Roadmap

Quarter	Initiative	Outcome
Q1	Assistant v1 (offline + live AI)	Conversational discovery,
Q2	Personalization	Recommendations from order
Q2	Voice input	Speak your craving
Q3	Conversational checkout	Add-to-cart from chat with in-
Q3	Multi-language (Hindi + regional)	Answer in the customers
Q4	Proactive engagement	Push offers and reorder reminders driven by the

14. Frequently Asked Questions

- Does the assistant need an API key to work? - - No. With AI_API_KEY empty it runs in offline mode with full coverage of catalog questions.
- Which AI providers are supported? - - Any OpenAI-compatible chat-completions API: OpenAI, DeepSeek, Groq, OpenRouter (Claude + Gemini), Together, Ollama, Azure.
- Does it cost money when idle? - - No. Calls happen only when a user sends a message.
- Can it actually place an order? - - v1 guides and navigates; conversational add-to-cart is on the Q3 roadmap.
- How do I enable live conversations? - - Set AI_API_KEY (and optionally AI_BASE_URL / AI_MODEL) in server/.env and restart the API.
- Is my data sent to the provider? - - Only the last eight conversation turns and a catalog snapshot. No passwords or payment data.
- Where can I download this document? - - Click "Download AI Assistant Spec (PDF)" on the About page.

Appendix A

Restaurant Catalog - 8 partner restaurants and 113 dishes, with photographs.

Restaurant	Cuisine	Rating	Reviews	Delivery
